Cellulose dissolved in a mixture of LiCl and AcNMe2 was esterified with 4-perfluoro(3-isopropyl-4-methyl-2-penten-2-yloxy)phthalic anhydride (I) using Et3N or pyridine as a catalyst. The products obtained with either catalyst had the same degree of substitution (DS) of 2.1. Fluorine-containing cellulose derivs. with DS of 0.16 and 0.36 were also prepared by esterifications of Et cellulose (II) (DS = 2.5) with I and with

```
1,1,2,2,3-pentafluoropropoxy-2,2-difluoropropionyl fluoride (III), resp.
Formation of these esters was confirmed by IR and 1H- and 19F-NMR spectra.
Dynamic viscoelastic and thermoplastic characteristics of cellulose and II
were changed considerably by their derivatization. Refractive indexes of
the fluorine-containing cellulose derivs. were relatively low, 1.443-1.458.
All the products were less hygroscopic than the starting materials. II,
I-esterified II, and III-esterified II had low dielec. consts. and low
dielec. loss tangents, so they could be regarded as good insulators.

Undiscolored foams with uniform, fine cells, useful in covering elec. AB cables, are prepared by molding molten fluoropolymers in the presence of a depolymerizable polymers of (fluoro)olefins, polyethers, or C2-20 polycarbonyloxy compds and, optionally, nucleating agents. Thus, a mixture of 1 part BN (particle size 1-8µ) and 100 parts 82:18 C2F4-C3F6 copolymer was pelletized, mixed with 1.0 part Me methacrylate polymer (particle size <500 m) and extruded to a foam with expansion ratio 60%, uniform cells, and no discoloration.

AB An etchant for etching a Cr or Cr oxide layer (e.g., in the preparation of masks for transferring patterns to semiconductor wafers) is composed of a Ce(IV) salt, a nonionic or anionic F-containing surfactant, H2O, and, optionally, >1 of HC1O4, HOAC, H2SO4, HNO3, HC1, and their salts.

The etchant can homogeneously etch a resist pattern having both wide and narrow gaps on a Cr or Cr oxide layer.

AB Chemical and thermally stable halogen-containing polyethers useful as lubricants

are prepared by ring-opening polymerization of 2,2,3,3-tetrafluorooxetane (I) and

optional fluorination and/or chlorination. Thus, F(CH2CF2CF2O)nCH2CF2COF (II) was prepared by ring-opening polymerization of I in the presence of CsF. A

reactor containing 1.5 kg II was heated to 100°-120°. The II was irradiated with a Hg lamp as a mixture of F(g) and N(g) was fed to the reactor at 1 L/min for 100 h, and then N was fed at 2 L/min for 50 h. A viscous fluoropolymer (1.8 kg) having CF2CF2CF2O repeating units, with kinematic viscosity at 40° (v) 65 cS, was formed. A rotary vacuum pump using the viscous fluoropolymer as lubricant was used in an apparatus to form O, H, and CC14 plasmas. After 30 days operation the pump motor showed no current irregularity, and the lubricant still had v 65 cS.
